

Building Mitigation

**Updated: 19 Dec 2024**

We are aware of the presence of Reinforced Autoclaved Aerated Concrete (RAAC) in areas of our roof and are satisfied that our building remains safe for staff and the public. A structural engineer has inspected Northern Stage and we have taken steps in line with the recommendations in their report to mitigate risk. This includes precautionary bracing in some areas backstage and increased monitoring. Our team are working closely with funders and partners, including Newcastle University, to develop plans for a long term solution, which we will share in due course. In the meantime our programme continues as usual and we look forward to welcoming you to Northern Stage in 2025.
